

## Bottle Cap Test (BCT100)

The OCS Bottle Cap Test (BCT100) is a compact solution for testing bottle caps and plastic bottles for crack resistance under combined chemical and mechanical stress in the laboratory. The system has 50 independent measuring stations, distributed across 5 measuring groups, which can be used flexibly for cap or bottle testing. The equipment includes a compressed air system, temperature-controlled wetting agent baths and a touchscreen control panel. The electronics are housed in a lockable, water-resistant control cabinet.

### Testable Raw Materials

- Polyethylene materials

### Features

- 50 measuring stations in 5 groups, each with individual load settings
- Wide range of load conditions possible (temperature, pressure, leakage and wetting agent)
- Precise and continuous measurement and documentation of test conditions
- Uniform bath temperature control in 2 independently usable baths
- No time limit on test times, time resolution: 1 sec. (real time)
- Operation via modern touch panel technology
- Visual and acoustic alarm functions for maximum safety
- Flexible and scalable trend visualization
- High chemical resistance of the materials used
- Individually configurable report output
- Flexible and secure data connection with state-of-the-art communication standards

### Address

OCS Optical Control Systems GmbH  
Wullener Feld 24  
58454 Witten  
Germany

## Technical Details

<b>Load pressure range</b>	0 – 6 bar (continuously adjustable)
<b>Wetting agent bath temperature</b>	25 – 80 °C (continuously adjustable)
<b>Leakage measurement</b>	Flow sensors with a resolution of 10 ml/min
<b>Communication protocol</b>	MODBUS (RTU, TCP/IP), PROFIBUS, PROFINET, OPC (server/client), CSV file, customised
